US SPACE TRAVEL

A TIMELINE OF MANNED NASA FLIGHTS

On July 21, 2011, the last Space Shuttle flight landed, ending 50 years of manned NASA flights. The US space program began in 1961 and resulted in 166 nearly continuous missions, costing an estimated $7 billion per year. Space travel continues through international partnerships and unmanned missions, but it remains to be seen what is next for American space exploration.

Gestalt Principles of Visual Perception

Closure. We tend to perceive objects such as shapes, letters, pictures, etc., as being whole when they are not complete. Specifically, when parts of a whole picture are missing, our perception fills in the visual gap.

Continuity. Elements of objects tend to be grouped together, and therefore integrated into perceptual wholes if they are aligned within an object. In cases where there is an intersection between objects, individuals tend to perceive the two objects as two single uninterrupted entities.
